

# St Michael's College Biodiversity Educational poster project

## Step 1

Our task was to educate ourselves and our school about the vast biodiversity that exists in our school Environment. So we met Dale the School landscaper and he brought us on a walking tour of the many plant, trees and animals that were living on our school grounds. We took down notes on the plants and animals that lived within our gates.

## Step 2.

We took all that information, put it up on the white board and organised it. Due to the large amount of information and task we divided our jobs up.

## Step 3

We arranged to meet over our midterm, when the school was a little quieter and we had full use of the resources such as the computer room, printers and the laminator.

## Step 4

We researched each plant and animal that we Dale had informed us about. We found a good suitable image to use on the internet and then we typed up some bite size information. Once completed we emailed these to our colleague who edited the information and had access to a colour printer to print them from.

## Step 5

We Printed all our information and then laminated it. We had obtained an A0 sized architectural plan of the school that we used.

## Step 6

We cut out all the information once it was laminated and paper clipped it together.

## Step 7

We then organised the best way to display the information on our architectural plans. When we were happy with this we glued in the information and pencil coloured in green where our school's biodiversity could be found.

## Step 8

Mr O'Flynn brought our completed poster up to Snap printing to be laminated. When it returned we put it on our Green schools noticed board where it could educate our students about the vast Biodiversity to be found in St. Michael's College.
